

Daily Checklist for Powered Air Respirators

Check for the following at the start of each day:

Headtop

- Any chips or cracks on headtop.
- Damage to seals on visor and cape.
- Lens condition - replace lenses & tear-off lens as needed.
- Rips or tears in cape or hood.
- Cleanliness or damage to the head harness system (brow pad, padding and straps).

PAPR

- Any chips or cracks on the PAPR.
- Cracks or splits in the breathing tube.
- Check battery charge and flow rate.
- Change pre-filter, check spark arrestor for damage.
- Inspect HEPA filter for debris and cleanliness.

Please note, should you find any damage or signs of depreciation that will interfere with the respirators ability to perform, **DO NOT** use the respirator until the part in question has been replaced. In not doing so, you risk voiding the NIOSH certification and placing the user at risk of the hazards in their environment as they may no longer be sufficiently protected.
